seq search request

Hi David,

Subject:

This is a Markush search and each SEQ ID is a very short peptide seq. Enjoy!

Joe

Shubo "Joe" Zhou, Ph.D. Patent Examiner (703)-605-1158 CM1/12D06 AU 1631, US PTO

Search Request

\*

Requester's full name: Shubo "Joe" Zhou

**Examiner #:** 78282

Art Unit: 1631

**Phone #:** 703-605-1158

Mailbox #: 12D01/CM1

Results format: pape

New Room #: 12D06

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention describes composition of matter (1) comprising an FC domain, pharmacologically active peptides, and linkers. Where (1) is: (X1)a-F1-(X2)b, where F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)C-F1-(L2)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently selected from -(L1)C-F1-(L2)d-P2-(L3)d-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAAA69526 and AAB10955 to AAB18033 represent uncention acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VBGF; immunosuppressive; EPO; TPO; CTLA4; minetic; IL-1; TMF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; vactotoxic; Teall Jymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.

C (Main, pharmacologicalities composition, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2-(L3)d-P3, or -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2-(L3)d-P3, or -(L1)c-P1-(L2)d-P2-(L3)d-P3.

(L1)c-P1-(L2)d-P2-(L3)d-P3, or -(L1)c-P1-(L2)d-P2-(L3)d-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and as b, c, d, e, and f = are each independently linkers; and as t, c, d, e, and f = are each independently linkers; and as t, c, d, e, and f = are each independently linkers; and as t, c, d, e, and f = are each independently linkers; and as t, c, d, e, and f = are each independently linkers; and as t, c, d, e, and f = are each independently linkers; and as t, c, d, e, and f = are each independently linkers; and as t, c, d, e, and f = are each independently linkers; and an extitution, and positions. The compositions are useful for treather functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA89526 and AAB16955 to AAB1803 represent invention.
                                                       The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-FI-(X2)b, where: FI = an FC domain; XI and X2 = are each independently selected from -(II)C-FI-(II)C-PI-(IZ)d-F2.

(II)C-FI-(IZ)d-F2-(I3)e-P-3, or -(II)C-FI-(IZ)d-F2-(I3)e-F3-(I4)F-P4 where PI, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; IJ, IZ, I3, and I4 = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently of provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer asthma, thrombosis, or autoimmune diseases. The use of a FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein and possibly placental transfer. AAA69443 to AAAA69526 and AAB16955 to AAB18033 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                  4;

useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18035 to AAAB180303 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
          The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where FI = an FC domain, X1 and X2 = are each independently selected from -(L1)c-F1-(L2)d-F2, -(L1)c-F1-(L2)d-F2, -(L3)e-F3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently of or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombollytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

"(L1)c-P1-(L2)d-P2-(L3) = P-73, or -(L1)c-P1-(L2)d-P2-(L3)d-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a lost consolition and activities. DNAs, vectors and host cells from the present inventions are used for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions are used for for comporate functions such as Fc receptor binding, protein half-life or incorporate function, and possibly placental transfer. AAA69443 to AAAA6955 and AAB16955 to AAB1803 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (x.1)a-(x.2)b, where: F1 = an FC domain, X1 and X2 = are each independently selected from - (L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)d-P2-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; finuncosuppressive; BPO; TPO; CTLA4; minetic; IL-1; TNF; antiagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

                   pharmacologically active peptides; Li, Li, Li, Li, and Li = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18035 to AAAB180303 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 an

independently linkers; and a, b, c, d, e, and f = are each independently of or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18032 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-FI-(X2)b, where FI = an FC domain, X1 and X2 = are each independently selected from -(Li)c-PI-(Li)c-PI-(L2)d-P2, -(L1)c-PI-(L2)d-P2, -(L3)e-P3, and P4 = are each independently sequences of pharmacologically active peptides; Li, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or I, provided that at least 1 of a and b is 1. The composition can

have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, trombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer. The use of morporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_2-x_1_0, X_2-x_1_1, X_2-x_1_2,
                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "optionally modified by bromoacetyl or PEG"

A compound which binds to an mpl receptor comprising a thrombopoietin

mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2],

is new. TMP_1 and TMP_2 are amino acid sequences varying from at least

10 to 14 residues in length comprising x_2-x_1_0, x_2-x_1_1, x_2-x_1_2,

x_2-x_1-3, x_2-x_1-4, x_1-x_1-0, x_1-x_1-1, x_1-x_1-2, x_1-x_1-3, and

x_1-x_1-4, x_1-1, x_1-1, x_1-x_1-1, x_1-x_1-2, x_1-x_1-3, and

x_4 = P; X_5 = T or S; X_6 = L, I, V, A or F; X_7 = R or K; x_8 = 0, N,

CC X_4 = P; X_5 = T or S; X_1-2 = L, I, V, A, F; M, Or K; X_1-1 = A, I, V,

CC T, V, N, O or G; X_1-4 = A, I, V, L, F; G, S, or G; L, 1 = linker

CC omprising 1 to 20 amino acids; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0 or 1. The compounds bind to acid; and n = 0

The present invention describes composition of matter (I) comprising an Fr domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a+F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-F1-(L2)c+P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2. P3, and P4 = are each independently sequences of pharmacologically active peptides: L1, L2, L3, and L4 = are each independently active peptides: L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently independently linkers; and a, b, c, d, e, and f = are each independently love cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein and mining, complement fixation, and possibly placental transfer. NAA69443 to AAA69526 and AAB16955 to AAB18013 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor blading, protein A binding, complement fixation, and possibly placental transfer. AAA6943 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
    The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-P1-(X2)b. where: F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-P1 -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L3)d-P2, -(L3)d-P2, -(L3)d-P2, -(L3)d-P2, -(L3)d-P2, -(L3)d-P2, -(L3)d-P2, -(L3)d-P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently on r1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          autoimmune disease, cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoiethi; thrombopoieth; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.

The present invention describes composition of matter (1) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (1) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(1).C-F1-(12)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently or provided that at least 1 of a and b 11. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB1803 represent invention.

Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia

Example 2A; Page 48; 91pp; English.

Overlapping oligonucleotides were used to construct a synthetic gene encoding a thrombopoietin mimetic peptide (TMP), which was then fused in-frame to the Pc region of the human IgGl chain (see AAY96529). A compound which binds to an mpl receptor comprising a TMP dimer joined by a linker [TMP\_1 (L\_1), nTMP\_2], is new. TMP\_1 and TMP\_2 are amino acid sequences varying from at least 10 to 14 residues in

where Pl, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently lo or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be useful for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (x,1)_{R+\Gamma}(x,2)_{D}, where: FI = an FC domain; XI and X2 = are each independently selected from -(L1)_C-P1, -(L1)_C-P1-(L2)_d-P2, -(L4)_F-P4 -(L1)_C-P1-(L2)_d-P2-(L3)_E-P3, or -(L1)_C-P1-(L2)_d-P2-(L3)_E-P3-(L4)_F-P4
                                                                                                                                                                                                                                                                                                                                                                                 Gaps

TMP1 and TMP2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_2 - X_1 = 0, X_2 - X_1 = 1, X_2 - X_2 = 1, X_2 - X_2 - X_2 = 1, X_3 
where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently loor 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNas, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor blading, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunoglobulin; IgG1; Fc; thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anaemic; dermatological; immunosuppressive; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4;

```
platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where FI = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L3)e-P2-(L3)e-P2, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, and P4 = are each independently sequences of pharmacologically active peptides; I1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently of the peptides; and a b, c, d, e, and f = are each independently of the composition can or 1, provided that at least 1 of a and b is 1. The composition can
the c-Mpl receptor which mediates the activity of endogenous
                                                                   thrombopoietin. The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, we have the control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMF; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

                       AAA69443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-rP-(X2)b, where F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L3)e-P2, -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently of or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         autoimmune disease, cytostatic; antiastimatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMF; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
